Writing transactional SMS: the key fact first, references and amounts, and one part only

WhatsApp & APIs Created on **November 13, 2026** 3 min read

The short answer: a good transactional SMS says **what happened in the first sentence**, carries **the reference** (order, invoice or booking number), gives **the next step** and fits in **a single part**: up to 160 characters in plain letters, or only 70 if the text has a letter outside the basic alphabet, such as the Portuguese «ã» or «ç». Cut everything that belongs in a formal letter.

The order that works

1. **What happened.** «Order shipped», «Payment received», «Appointment booked». It is what the customer reads in the notification, before opening the message.
2. **The reference.** The order, invoice or service number, exactly as the customer sees it on the receipt or on your website.
3. **The fact that matters.** The amount, the date, the time, the collection code.
4. **The next step or the contact.** Where to collect, by when, or how to reach you, because the SMS cannot take replies.

Before and after

Version	Message	Parts
Before	`Dear customer, we are pleased to let you know that your order number 8812, placed on our website on 10 November, has now been dispatched and will reach you soon.`	2 (161 characters: one over the single-part limit)

Version	Message	Parts
After	`Order no. 8812 shipped today. Arrives by 15/11. Questions? Check its status on our website.`	1 (91 characters)

The second one says more (the arrival date and where to track the order) and costs half. In a system sending thousands of notices a month, that difference shows in the balance.

The characters that cost more

What you type	What happens
Plain letters, digits, common punctuation, plus é, à and a capital Ç	Basic alphabet: up to 160 characters in one part; above that, up to 153 per part.
A single ã, õ, á, í, ó, ú, â, ê, ô, lower-case ç, an emoji or curly quotes	The whole message switches to Unicode: up to 70 in one part; above that, up to 67 per part.
€ [ ] { } ^ ~ \ |	Count as 2 characters in the basic alphabet.

Watch out for text pasted from a document: it brings curly quotes and long dashes that switch the message to Unicode without anyone noticing. Names do the same: «João» in a personalised text is enough. The technical background is in **GSM-7 or Unicode**.

Dates, amounts and abbreviations

1. **Dates in figures** (15/11) and clear times (17:30): short and unambiguous.
2. **Amounts with the currency**, as on the receipt: 1,500 MT.
3. **Only abbreviations everyone knows** (no., Dr). Text-speak saves little and looks careless.
4. **No shouting in capitals**, except for one word such as ALERT in a security notice.

Before a text goes into your system, try it.
In the API Sandbox the answer shows how many parts and which alphabet it would use (`parts` and `encoding`) without sending anything; in the SMS Center, the page shows the parts and credits before you confirm.

RECOMMENDED

Ready to have these texts go out from your system on their own? See Transactional SMS.
