SMS webhook not arriving or rejected: HTTPS, signature, the 5-second answer and retries

WhatsApp & APIs Created on **November 13, 2026** 3 min read

The short answer: it is nearly always one of five things: the address is **not HTTPS on port 443**, it is a **private address**, your server **takes more than 5 seconds** to answer, the **signature** is checked against the wrong body, or the message was created **before** the webhook was saved. Always start with `POST /v1/sms/webhook/test`: it shows what your server answered.

The checklist

Symptom	Likely cause	What to do
The webhook will not save	Address without HTTPS, on another port, or internal	Use https:// on port 443, at a public address.
The test returns an error or times out	Your server did not answer with a 2xx code within 5 seconds	Answer 200 at once and do the work afterwards, in a queue of your own.
Your code rejects every notice	The signature is computed over an already parsed body, or with the old secret	Use the raw body exactly as it arrived, and the current secret.
It rejects only some notices	Server clock running late, so t looks old	Fix the server time and allow a sensible tolerance.
One message never triggered a notice	It was created before the webhook was saved	Look it up with GET /v1/sms/messages/{id}.
The same notice arrived twice	Your server did not answer in time and we retried	Handle notices by message id and event; ignore the repeat.

Checking the signature

The **X-Webhook-Signature** header looks like `t=<unix time>,v1=<hex>`. v1 is the HMAC-SHA256 of `t + "." + body` using your secret. In PHP:

```
$body = file_get_contents('php://input'); // the raw body, as it arrived
parse_str(str_replace(',', '&', $_SERVER['HTTP_X_WEBHOOK_SIGNATURE'] ?? ''), $a);
$expected = hash_hmac('sha256', ($a['t'] ?? '') . '.' . $body, $secret);
$fresh = abs(time() - (int) ($a['t'] ?? 0)) < 300; // tolerance of your choosing
if (!$fresh || !hash_equals($expected, $a['v1'] ?? '')) { http_response_code(401); exit;
}
http_response_code(200); // answer now; process the notice afterwards
```

More detail, and the same idea in other languages, in **receiving a webhook in PHP and checking its signature**.

The retries

If your server does not answer with a 2xx within 5 seconds, we try again after **1 minute, 5 minutes, 30 minutes, 2 hours and 6 hours**. So a server that is down for a few hours does not lose notices, but it may get them late and, if it answered too slowly, more than once.

Do not do the heavy lifting before you answer.
Sending an e-mail, building a PDF or calling another service inside the request is the most common cause of the 5-second timeout. Save the notice, answer 200 and handle it next.

Rotated the secret?
Asking for a new one with rotate_secret replaces the old one for the notices that follow. Update your server at the same moment, or it starts rejecting everything.

RECOMMENDED

Still nothing reaching your address? See the API page, or contact us with the request's correlation_id.
