Stopping one program from spending AI credits without deactivating everything

Getting Started & Activation Created on **November 28, 2026** 2 min read

Deactivating All in One AI stops everything at once: the page, the API, your agents and your tools. If the problem is a single program spending credits, there are ways to stop it without touching anything else.

1. Find out what is spending

In **History**, the **By key** block shows the requests and credits of each key, with the name you gave it in the **API Center**. Click the name to see only that key's requests. Requests made on the page show as "All in One AI Playground".

2. Stop only that program

If the program uses	Do this	What happens
An API key	Revoke the key in the API Center.	Requests with that key start answering `401`. Your other keys keep working.
An app connected through the MCP server, such as ChatGPT	At the bottom of History, under **Connected apps**, click **Revoke access**.	The app can no longer use AI on your account, straight away.
One of your agents	On the Agents tab, click **Pause**.	Requests with that agent answer `409` with `agent_paused` until you turn it back on.
A person on your team	On the Team tab, untick **Can use** or set a monthly limit.	The person stops using AI, or stops when they reach the limit.

If the program really has to keep running, create a new key for it afterwards, with only `ai:read` and `ai:write`. See **creating a key**.

3. Put a ceiling on what the account spends

On the **Buy credits** tab, the **Spending limits** block lets you choose how many credits AI can spend per day and per month, in the API, the Playground and Agents. When a limit is reached, requests stop until the reset: every day at 00:00 and on the 1st of each month. Coding Plan points do not count. By default there is no limit. This ceiling applies to the whole account, not to one program.

The key spending limit does not help here.
That limit counts the account balance in MT spent on purchases and invoices through the API, not AI credits.

For next time: one key per program. That way, revoking one does not stop the others. If a key ended up in the wrong place, see **what to do, in the right order**.

RECOMMENDED

Want to see which key is spending? Open your All in One AI History.

See All in One AI →
